

# Wellvana Scales its Value-Based Care Infrastructure with 10Bridge

Wellvana partnered with 10Bridge to expand and standardize its data integration infrastructure while also enabling new data driven lines of business. Operating across a highly fragmented and fast-growing ecosystem of provider organizations, disparate EHR systems and disconnected data sources, Wellvana required a scalable interoperability platform and committed service partner to support their providers' mission to improve patient outcomes, enhance care coordination, and strengthen financial performance.

With 10Bridge as its enterprise interoperability platform, Wellvana unified disparate clinical data sources into a standardized, enterprise-ready data infrastructure - enabling faster provider onboarding, improved data integrity, and extended care management and retrospective RCM lines of service.

## The Challenge

Wellvana's growth and service offerings were constrained by the complexity of interoperability at scale, i.e. wide variety of data formats, connectivity and security requirements.

Scale	Standardization
 450+ provider sites across multiple platforms	 40+ disparate EHR Systems
 Millions of Patient Records	 Disconnected HIT Systems
 Need for highly redundant, secured and compliant integration infrastructure	 Non-standardized file formats and incomplete data feeds

Traditional integration approaches required custom, one-off builds, delivered incomplete datasets, and lacked normalization capabilities. This resulted in incomplete care gap analysis, inconsistent quality reporting, missed revenue opportunities, and delayed provider onboarding.

## The Solution

Wellvana deployed 10Bridge as a centralized, cloud-native interoperability platform to automate extraction, normalization, and routing of a broad set of administrative, clinical and financial data. Core capabilities include:

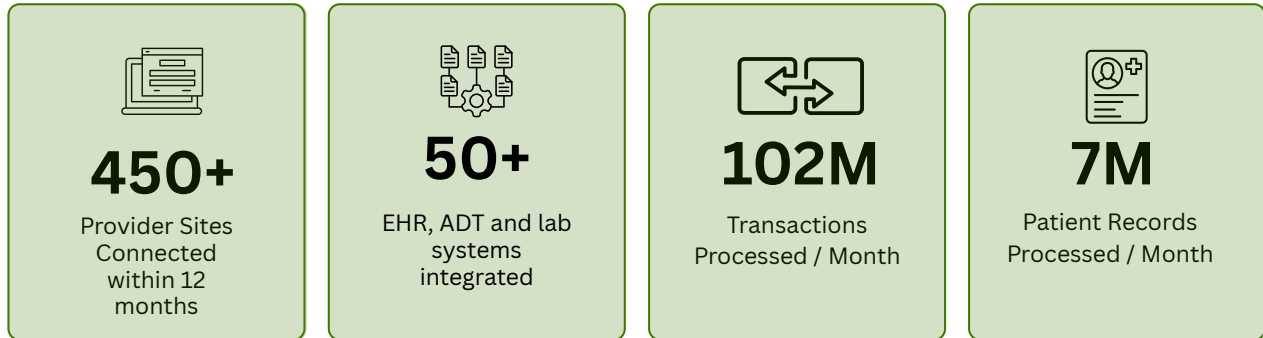

- Automated extraction of complete patient datasets (improved data acquisition to 99% of all targeted data)
- Expanded integration with targeted data source systems (EHR, HIE, ADT platforms, etc.)
- Event and/or trigger enabled integration workflow for file splitting, concatenation and workflow routing

- AI-enabled data validation, filtering and alert notifications
- Transformation of thirty-three (33) different inbound file formats into standardized formats
- Secure delivery to downstream platforms – population health, RCM retrospective billing and data archival systems

## The Results

10Bridge transformed Wellvana’s interoperability strategy into a secure, standardized, enterprise-scale data infrastructure.

### Operational Scale

### Business and Strategic Impact

- Faster onboarding of new providers
- Scalable growth without systems integration constraints
- Expanded data sets captured and integrated
- Increased transactional throughput and data processing
- Standardized data mapping for downstream workflows
- Multi-endpoint data routing enabling new lines of service
- Comprehensive care management analytics
- Reliable quality reporting for CMS and payers

### “ Client Perspective

“The foundation of Wellvana’s care management strategy depends on data acquisition,” said Philips Johnson, CTO of Wellvana. “With 10Bridge, we have a systems integration partner that has an enterprise-level interoperability platform, has deep domain expertise, but most importantly works closely with our team to solve integration challenges and deliver value-add solutions,” continued Johnson.

## About Wellvana

Wellvana is one of the largest value-based care enablement companies, partnering with primary care practices, health systems and Accountable Care Organizations to make the transition from fee-for-service to value-based care management for their patients. The organization focuses on improving patient outcomes, enhancing care coordination, and optimizing financial performance through scalable, data-driven infrastructure. Wellvana supports health care providers in 40 states, serving approximately 1 million Medicare patients.
